Anno Accademico 2015/2016

Introduction

Digital images are easy to manipulate thanks to the availability of the **powerful editing software** and **sophisticated digital cameras**.

The development of methods for verifying **image authenticity** is a real need in forensics.

Introduction

Digital images are easy to manipulate thanks to the availability of the **powerful editing software** and **sophisticated digital cameras**.

The development of methods for verifying **image authenticity** is a real need in forensics.

Purpose: to detect image splicing aimed at *deceiving* the viewer.

Image forensic detection techniques search for *traces*, called *footprints*, that can be grouped into:

Image forensic detection techniques search for *traces*, called *footprints*, that can be grouped into:

1. **Signal level**: signal specific properties left during the editing phase that can be revealed using signal processing-based tools.

Image forensic detection techniques search for *traces*, called *footprints*, that can be grouped into:

- Signal level: signal specific properties left during the editing phase that can be revealed using signal processing-based tools.
- 2. **Scene level**: exploiting inconsistencies in scene shadows, lights, reflections, perspective, and geometry of objects.

Image forensic detection techniques search for *traces*, called *footprints*, that can be grouped into:

- Signal level: signal specific properties left during the editing phase that can be revealed using signal processing-based tools.
- 2. **Scene level**: exploiting inconsistencies in scene shadows, lights, reflections, perspective, and geometry of objects.

Main advantage: being fairly independent on low-level characteristics of images, they are extremely robust to compression, altering, and other image processing operations

Methods based on **lighting inconsistencies** are particularly *robust*: a perfect illumination adjustment in a image composition is very hard to achieve.

Methods based on **lighting inconsistencies** are particularly *robust*: a perfect illumination adjustment in a image composition is very hard to achieve.

1. Object light source inconsistencies

Methods based on **lighting inconsistencies** are particularly *robust*: a perfect illumination adjustment in a image composition is very hard to achieve.

- 1. Object light source inconsistencies
- 2. Illuminant colors inconsistencies

Methods based on **lighting inconsistencies** are particularly *robust*: a perfect illumination adjustment in a image composition is very hard to achieve.

- 1. Object light source inconsistencies
- 2. Illuminant colors inconsistencies
 - 2.1 Specular dichromatic reflectance models (Gholap and Bora, 2008 [5])
 - 2.2 Illuminant Maps (IMs)

Illuminant Maps estimation

For the *Illuminant Maps* estimation, two different *state-of-art* techniques are used:

- 1. A statistical-based approach using **Generalized Grayworld Estimate** (**GGE**) algorithm (Van de Weijer et al., 2007 [3]). Rely on hypotheses related to statistics of image pixels (e.g. the gray world assumption).
- 2. A *physics-based* approach using **Inverse-Intensity Chromaticity (IIC)** method (Riess and Angelopoulou, 2010 [4]). Rely on theoretical formulations of how light interacts with objects (e.g. *the dichromatic reflectance model*)

Main goal: starting from two different approaches, remove the Human from the Loop and introducing some improvements

- Face forgery detection module: specifically for detecting forgeries involving people. Based on the work presented by Carvalho et al. 2016 [1]. Improving and automating the detection process.
- Regional forgery detection module: image content independent. Based on the work presented by Fan et al. in 2015
 [2]. A more general and experimental approach.

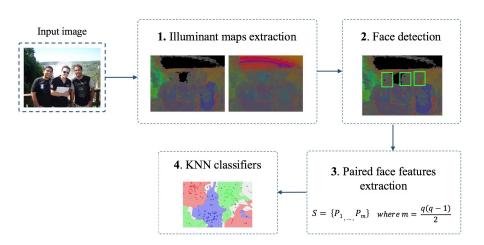

Input image

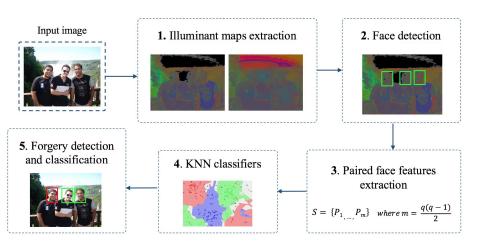

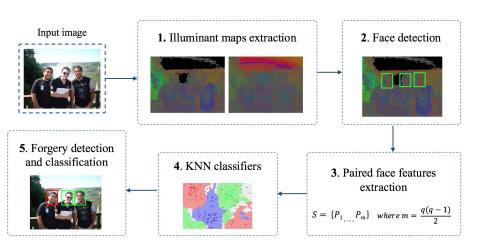

7 di 15

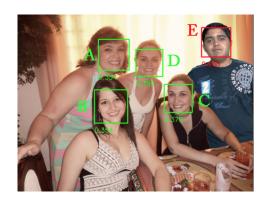

Introducing a face detector and soft classification scores.

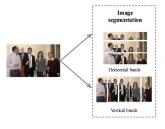

7 di 15

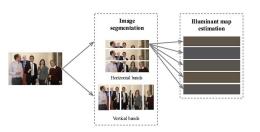

The output of the algorithm consist in a **forgery score** for each detected face.

Face	Score		
Α	0.354		
В	0.354		
C	0.375		
D	0.396		
E	0.936		

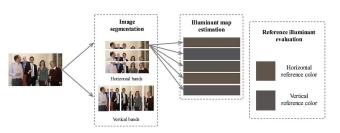

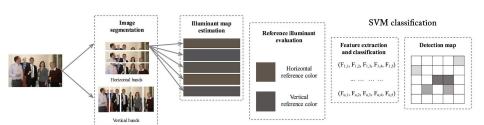

$$ke^{n,p,\sigma} = \left(\int \left|\frac{\vartheta^n \mathbf{f}^{\sigma}(\mathbf{x})}{\vartheta \mathbf{x}^n}\right|^p d\mathbf{x}\right)^{\frac{1}{p}}$$

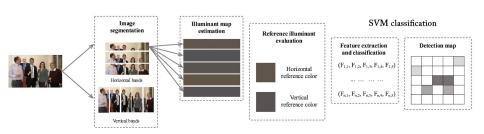

$$ke^{n,p,\sigma} = \left(\int \left|\frac{\vartheta^n \mathbf{f}^{\sigma}(\mathbf{x})}{\vartheta \mathbf{x}^n}\right|^p d\mathbf{x}\right)^{\frac{1}{p}}$$

GGE estimation

$$ke^{n,p,\sigma} = \left(\int \left|\frac{\vartheta^n \mathbf{f}^{\sigma}(\mathbf{x})}{\vartheta \mathbf{x}^n}\right|^p d\mathbf{x}\right)^{\frac{1}{p}}$$

 $ke^{n,p,\sigma} = \left(\int \left|\frac{\vartheta^n \mathbf{f}^{\sigma}(\mathbf{x})}{\vartheta \mathbf{x}^n}\right|^p d\mathbf{x}\right)^{\frac{1}{p}}$

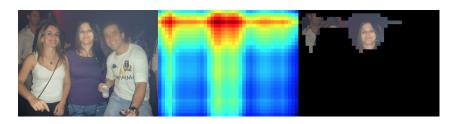

GGE estimation

Two different reference colors are considered:

- Median: the median illuminant color for each direction
- Global: the whole image illuminant color

9 di 15

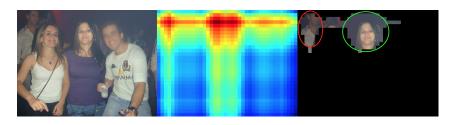

The output of the algorithm consist in the forgery **regional mask**.

Work best in presence of **uniform backgrounds colors** and simple light settings.

The output of the algorithm consist in the forgery **regional mask**.

Work best in presence of **uniform backgrounds colors** and simple light settings.

Evaluation datasets

- **DSO-1**: 200 indoor and outdoor images (100 original and 100 doctored) with an image resolution of 2048 x 1536 pixels.
- **DSI-1**: 50 downloaded images (25 original and 25 doctored) with different resolutions. Original images are downloaded from *Flickr*, doctored images collected from different websites.

Figura: DSO-1 sample spliced image Figura: DSI-1 sample spliced image

Experimental results for face forgery detection module.

N.	Train	Test	Faces	Accuracy	F-Score
1	DSO-1	DSO-1	540	0.81	0.64
2	DSI-1	DSI-1	133	0.75	0.66
3	DSO-1	DSI-1	540	0.63	0.25
4	DSI-1	DSO-1	130	0.67	0.37

Tabella: Performance of face forgery detection module over single faces using non-uniform weights.

Good results in **cross-validation** evaluations. In a cross dataset approach, the dataset used for training makes the difference.

Experimental results for regional forgery detection module.

Test case	Train	RC	ACC	AUC	F-Score
Test 1	SplicedCC	Median	0.54	0.53	0.26
Test 2	SplicedCC	Global	0.57	0.57	0.31
Test 3	SplicedDSO	Median	0.53	0.50	0.27
Test 4	SplicedDSO	Global	0.61	0.63	0.33

Tabella: Performance of region forgery detection module

Experimental results for regional forgery detection module.

Test case	Train	RC	ACC	AUC	F-Score
Test 1	SplicedCC	Median	0.54	0.53	0.26
Test 2	SplicedCC	Global	0.57	0.57	0.31
Test 3	SplicedDSO	Median	0.53	0.50	0.27
Test 4	SplicedDSO	Global	0.61	0.63	0.33

Tabella: Performance of region forgery detection module

Experimental results for regional forgery detection module.

Test case	Train	RC	ACC	AUC	F-Score
Test 1	SplicedCC	Median	0.54	0.53	0.26
Test 2	SplicedCC	Global	0.57	0.57	0.31
Test 3	SplicedDSO	Median	0.53	0.50	0.27
Test 4	SplicedDSO	Global	0.61	0.63	0.33

Tabella: Performance of region forgery detection module

Better results achieved using the **global illuminant color** as reference.

Very low accuracy: not suitable for a forensic approach.

Conclusions

- Two different approaches for forgery detection are presented: a face forgery detection module and a generic region forgery detection module.
- Face module achieved most promising results, but it works only with images involving people forgeries.
- **Future developments**: extend the approach to generic objects with composed by similar material.
- Further improvements can be achieved when more advanced illuminant color estimators become available.
